

Press release

VBE Restorations announces an exciting new development that brings advanced computer technology to the reproduction of original or 'one-off' car bodies and interiors.

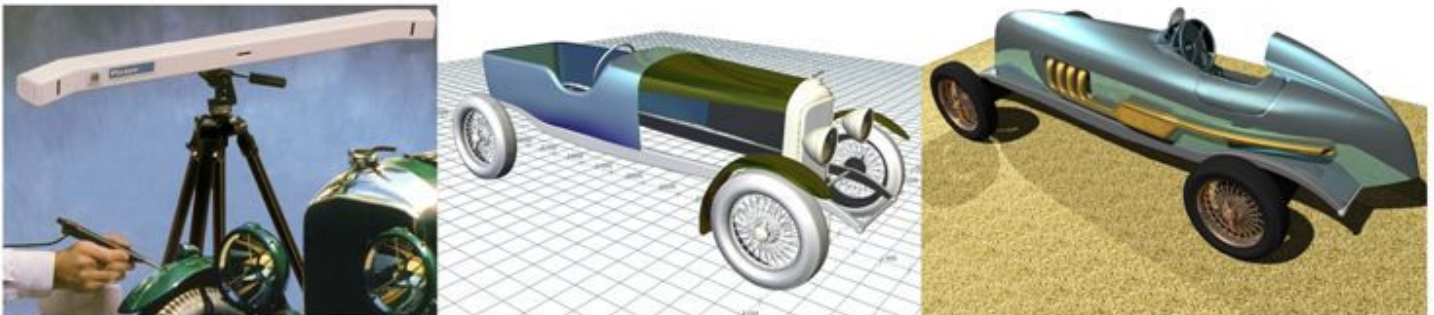

The 3D infrared scanning process enables existing body shapes to be captured digitally and then manipulated to produce scale drawings from which 'one-off' specials or facsimile bodies or components can be made.

The easily portable equipment is also ideal for trim design and bodywork modifications that can be visually displayed and dimensionally checked prior to actual manufacture.

The process will be demonstrated by VBE Restorations on their stand C12 in Hall 2 at the Race Retro Show at Stoneleigh Park from 13th to 15th March

Richard Cresswell of VBE said "We have been using this system 'in house' to design new bodywork and trim for old cars but we are now offering it as a service to other companies. It offers small companies a quick and affordable way of designing or redesigning bodywork without big company resources."

Richard Cresswell. MD VBE Restorations 12.03.09
